

## Persona 3: The Primary Care Physician

**Name:** Dr. Maya Rao

**Age:** 41

**Occupation:** Primary Care Physician

**Setting:** Busy family practice

**Specialty:** No ophthalmology specialization

**Uses DUAL:** Reviews reports to decide on referrals

*"I want a quick, reliable way to know which patients may need specialist review."*

### Background

Dr. Rao is not an eye specialist, but she decides which patients to send to one, and she has only a few minutes per patient to review screening information. She is careful with AI tools: she wants to know when the model is unsure, not just what it predicts.

### Goals

- Identify patients who may need specialist evaluation
- Support early detection and preventive care
- Review screening information quickly

### Needs

- Clear cataract and glaucoma screening results
- Clear risk and uncertainty indicators
- A clear recommended next step

### Pain Points

- Missing a patient who may need referral
- Over-referring patients unnecessarily
- Misinterpreting an uncertain AI result

### How DUAL Helps

- Separate results for each condition: Refer or No concern
- "Uncertain, refer" makes model doubt visible
- Later: calibrated confidence and Grad-CAM heatmaps

### Scenario

Dr. Rao reviews a DUAL screening report after a technician captures and analyzes a patient's fundus image. She checks both results, the uncertainty and the recommended next step, then decides whether further eye-care evaluation is appropriate.

*DUAL supports screening and referral decisions. It does not provide a diagnosis.*
